

Phoenix Shield

The new era of Speed, Strength and Power

Why Phoenix Shield

Palbit's Phoenix Shield series offers you cutting edge performance across the board in every steel turning operation.

PH2G grade series is an innovative combination of a highly dense and hard nanostructured coating base material, including new Al_2O_3 layer with improved wear resistance which provides superior performance during high-speed turning operations.

This new grade series features nanolayer optimization and cutting edge stability, achieved with pre- and post-coating process technologies, designed to improve adhesion between layers and fine-tune tensile stress within coating.

Despite the high wear resistance, the new grades also display enhanced performance on chipping prevention throughout instabilities. This greatly boosts strength, wear and heat resistance as well as tool life when compared to the previous generation coating.

The ultimate goal is machining process optimization, in order to address market demand for greater efficiency and higher cutting speeds. In addition, the increased use of high-strength materials in automotive components also demands for cutting tools with greater wear resistance.

Longer lasting and more reliable, the new Phoenix Shield series are sure to give you a step up in productivity and process security.

Unleash the power
of your turning
operations with
Phoenix Shield.

PH2G Series

Greatly improved Al_2O_3 coating, with optimised crystal orientation. Suitable for productive turning of steels & cast steels.

The ideal choice for most steel turning applications; from roughing to finishing, for continuous or interrupted cuts.

Technical features

Thanks to its innovative alumina layer, this new coating has greatly improved wear and heat resistance.

This enables better performance in the vast majority of steel turning applications, with greater material removal rates, and longer, more predictable tool life.

Unidirectional crystals

Advancements in the CVD process have allowed for a great deal of control over the direction in which alumina crystals are grown.

This ability enables the production of coatings in which every single alumina crystal provides maximum strength and wear resistance.

Other insert details

In addition to the alumina layer, this coating also features a yellow top layer, which allows for improved wear detection, and helps you identify unused edges, helping to reduce waste.

Furthermore, the very hard innermost TiCN layer also helps protect the insert from abrasive wear.

Technical Advices

Application

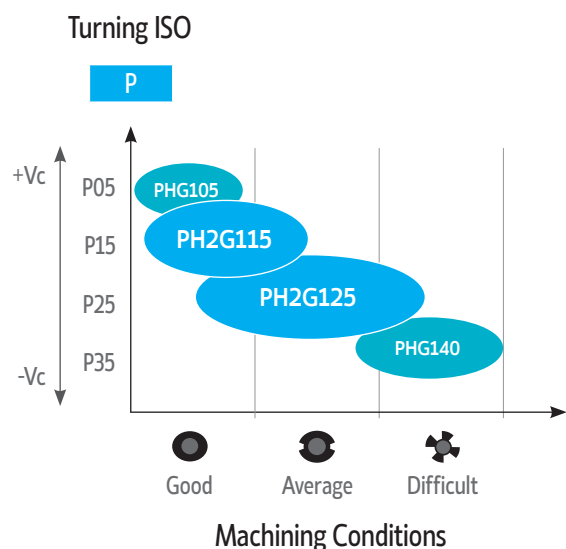

- Turning of steels and cast steels;
- From roughing to finishing operations;

PH2G115

- Harder grade, with improved heat resistance;
- For higher cutting speeds and continuous cutting;

PH2G125

- First choice for the majority of steel turning applications;
- Continuous or interrupted cutting, roughing or finishing;

Top coating (TiN)

Designed for easy recognition of insert tool life and wear pattern, combines with new surface treatment for lower adhesion, minimum built-up-edge and enhanced cutting edge stability. Also the special grinding treatment on both top and bottom surfaces, provides improved clamping stability widening the suitable range of applications.

CVD - Alumina coating (Al₂O₃)

The coating has been improved and developed to be an industry leading standard for crystal growth and densification on Al₂O₃ layer. This nano-control technology increases tool life and wear resistance due to the fine, dense crystal growth process.

Inner coating (Ti(C,N))

Very hard and abrasion resistant layer, produced from fine grain TiCN particles for greatly improved chipping resistance.

Substrate

Palbit's cemented carbide substrates combine high strength and insert toughness.
